

## ② Google App Engine - Software as a Service:

- Software as a Service is a way of delivering application over the internet as a service. Instead of installing & maintaining software, user can simply access it via the internet, which exempts for complex software hardware management.
- SaaS applications are sometimes web-based software or hosted software.
- SaaS customers have no hardware or software to buy, install & maintain.

③ - App Engine is a platform for building scalable web applications & mobile backends. App engine provides you with built-in services and APIs such as NoSQL datastore, cache and a user authentication API.
