

- Given, socket wrenches provide example of adaptor. Socket attaches to ratchet, provided that size of drive is same. Adaptor makes things work after they are designed. Bridge makes them work before they are used.

(3) It is a structural design pattern (proxy): It provides a place holder for another object to control access to it. Use an extra level of indirection to support distributed. Controlled access adds a wrapper & delegation to protect real component from undue complexity.

Given, check proxy provides a place holder to provide access to object. A check is a proxy for funds in account and ultimately controls the access to object in user's account.
